

Wireless Access Control

Cost Effective Security Solutions from Securicall Systems

It is important to have the ability of controlling all the doors in a building from one central location with just the click of a mouse. It is equally important to have the ability to monitor your access network, delete key cards and download audit trail information all in real-time. To do all of this without the trouble and cost of installing wires would be a real bonus. **Good news - this is available now!**

SECURICALL have years of experience in the Security Solutions market and fully understand the balance between Customers requirements and budget constraints. The SECURICALL portfolio of Security Solutions products and services ranges from simple Access Control Systems to sophisticated Integrated Enterprise Systems and their ongoing support.

Manage Facility Access across Multiple Sites

The wireless system is an on-line real-time battery powered access control system that uses radio frequency technology to communicate in real-time with the central computer.

The lock itself is intelligent and takes the decision to grant or deny access based on the users rights. The answer is immediate with no communication needed with the server or controllers, avoiding possible network problems and no emergency

master key needed.

In case of network failure, access is granted through a Virtual Network technology without compromising security or the user's access rights.

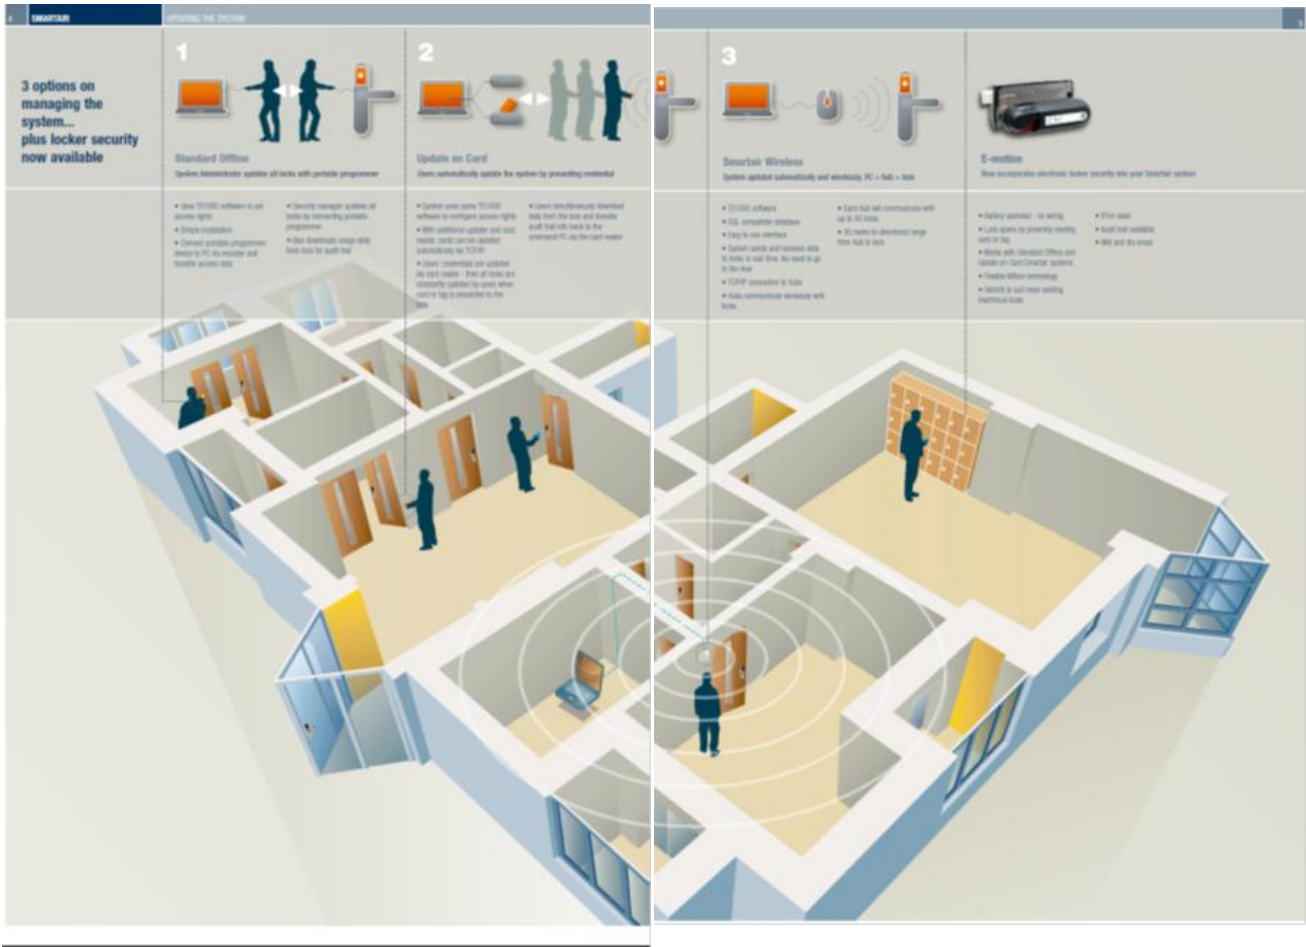

The gateway is the link between the PC and the wireless network (repeaters or/and wireless escutcheons). It gives real-time information to the PC.

One gateway can manage several wireless escutcheons and several repeaters making the wireless structure very flexible.

Key features & benefits

- The wireless system combines efficiency of both on-line and off-line applications in a single system.
- Real-time communication with state-of-the-art stand alone battery powered escutcheons simplifies security management and provides unrivalled levels of access control flexibility.
- The wireless system has efficient battery power consumption, which can be monitored by viewing the lock battery status in real time.
- Real time audit trail: View door access in real time without having to visit the door.
- Real time viewing of door status.
- Key management: Resolved in real time as the locks receive cancelled key updates as soon as they are generated.
- Any number of doors can be equipped with the wireless system at much lower cost than a conventional wired access control solution.
- The wireless system is compatible with most common RFID technologies including Mifare/DESfire and HID iClass.

TYPICAL WIRELESS ACCESS CONTROL SYSTEM

ONGOING SUPPORT

All Securicall's Access Control systems are fully supported by the company's dedicated engineering and service teams who have extensive experience in both Access and related security systems.

Return on investment

Many companies will already have much of the IP infrastructure in place to support IP based systems, but avoiding the need to install additional cabling make **Securicall's** Wireless Access a realistic and affordable solution.

With a commitment to deliver high-value security solutions, the smart design approach adopted by **Securicall** reduces capital expenditure and ongoing service costs.

WHY SECURICALL?

SECURICALL is a market leader in the provisioning of Security Solutions and have over 20 years experience in providing Customers with effective design, installation and on-going support.

Based from our regional offices, SECURICALL provides auditing and planning, design and implementation service to organisations across the UK.
